Enterprise Support Operations Analysis

Organization: Star Printers

Prepared by: Prathvi Bhat

Role: Business Analyst

1. Project Background

Star Printers provides leased printer services and customer support to enterprise customers across four geographical regions. Support requests are managed by multiple operational teams including Network, Hardware, Field, Remote and Logistics Support.

Customer issues are logged as support tickets and categorized according to issue type, priority, department, region, and assigned agent. Ticket performance is measured using operational indicators such as ticket volume, resolution time, SLA compliance, reopened tickets, and customer satisfaction.

Leadership requires a centralized reporting solution to monitor support operations, identify performance gaps, and support data-driven decision-making.

2. Business Problem

Star Printers lacked a centralized reporting view of enterprise support operations. Leadership had limited visibility into key operational measures such as ticket volume, SLA compliance, resolution performance, workload distribution, recurring issue categories, and customer satisfaction.

Without reliable and consolidated reporting, management faced difficulty identifying performance gaps, prioritizing areas for investigation, and making data-driven decisions regarding support operations and process improvement.

3. Business Objectives

The objectives of this project are to:

1. Provide leadership with centralized visibility into key enterprise support operations and performance indicators.
2. Evaluate ticket volume, SLA compliance, resolution performance, and customer satisfaction across relevant operational dimensions.
3. Identify high-volume issue categories, performance differences, workload patterns, and customers generating significant support demand.

4. Identify operational performance gaps and areas requiring further investigation or process improvement.
5. Provide data-driven insights and recommendations to support management decision-making.

4. Stakeholders

Stakeholder	Role in the Project	Key Interest
Executive Operations Leadership	Project Sponsor / Decision Maker	Overall operational performance, SLA and customer experience
Customer Support Manager	Business Owner	Ticket volume, SLA, workload and team performance
Team Leads	Operational Stakeholders	Workload, agent performance and escalations
Support Agents	Process Users	Ticket handling and issue resolution
Business Analyst	Requirements & Analysis	Requirements, data validation, analysis and reporting
IT / Data Team	Technical Stakeholder	Data availability and reporting solution

5. Project Scope

In scope:

- Analysis of 500 simulated customer-support tickets for January – March 2026 reporting period
- Data validation and cleaning
- Analysis of ticket volume, SLA compliance, resolution performance, and customer satisfaction
- Analysis by category, department, region, agent, and customer/account
- SQL-based data validation, KPI analysis, and operational analysis using MySQL
- Development of an Excel executive dashboard for operational KPI reporting
- Development of an interactive Tableau executive dashboard for management reporting and performance analysis
- Interactive filtering and performance comparison across relevant business dimensions
- Identification of operational trends, performance gaps, and data-quality issues
- Development of business insights and recommendations

Out of scope:

- Development or modification of a live ticket-management application
- Integration with production or enterprise systems

- Real-time data ingestion or automated data feeds
- Implementation of staffing, training, or operational recommendations
- Predictive analytics or machine-learning models
- Financial cost-benefit analysis
- Analysis of confidential or personally identifiable customer data

6. Business Requirements

ID	Business Requirement	Priority
BR-001	Leadership must be able to monitor total support-ticket volume for the reporting period.	Must Have
BR-002	Leadership must be able to monitor overall SLA compliance.	Must Have
BR-003	Management must be able to evaluate average ticket resolution time.	Must Have
BR-004	Management must be able to monitor average customer satisfaction.	Must Have
BR-005	Management must be able to identify support categories generating the highest ticket volume.	Must Have
BR-006	Management must be able to compare SLA performance across geographic regions.	Must Have
BR-007	Team leads must be able to evaluate workload distribution across support departments.	Must Have
BR-008	Management must be able to identify issue categories associated with longer resolution times.	Must Have
BR-009	Management must be able to identify enterprise customers generating the highest support demand.	Should Have
BR-010	Team leads must be able to compare customer satisfaction across support agents.	Should Have

7. Business Rules

BRULE-001: SLA compliance shall be determined by comparing each ticket's resolution time against its applicable SLA target.

BRULE-002: Tickets with no submitted customer rating shall be excluded from average customer-rating calculations.

BRULE-003: Ticket volume shall be determined using unique Ticket IDs.

BRULE-004: Reporting and analysis shall be limited to the January–March 2026 reporting period.

8. Key Performance Indicators

KPI	Purpose
Total Ticket Volume	Measure overall support demand
SLA Compliance %	Monitor the proportion of tickets resolved within the applicable SLA target
Average Resolution Time	Evaluate ticket-resolution efficiency
Average Customer Rating	Monitor customer satisfaction
Ticket Volume by Category	Identify high-volume issue categories
Ticket Volume by Customer/Account	Identify enterprise customers generating high support demand
SLA Compliance by Region	Compare regional SLA performance
Ticket Volume by Department	Evaluate workload distribution
Customer Rating by Agent	Compare customer satisfaction across support agents

9. Success Criteria

The project will be considered successful if the following criteria are met:

1. The solution provides centralized visibility into the agreed support-operation KPIs.
2. Management can evaluate support performance across relevant dimensions such as category, region, department, agent, and customer/account.
3. KPI calculations are validated against the available source data and defined business rules.
4. The reporting solution enables management to identify operational trends and performance gaps requiring further investigation.
5. The analysis provides evidence-based insights and recommendations to support management decision-making.

10. Assumptions

1. The supplied support-ticket records are assumed to represent the defined January–March 2026 reporting period.
2. Ticket classifications such as category, priority, department, region, and assigned agent are assumed to have been recorded according to the organization's defined support process.
3. SLA targets provided in the dataset are assumed to represent the applicable SLA expectations for the corresponding tickets.
4. Customer ratings are assumed to represent feedback voluntarily provided by customers.

11. Constraints / Limitations

1. The project is based on a simulated dataset of 500 support tickets and does not use live production data.
2. Analysis is limited to the fields and records available in the supplied dataset.
3. The reporting period covers only January–March 2026 and therefore does not support conclusions about longer-term or seasonal performance.
4. The supplied Resolution_Time values do not consistently reconcile with elapsed time calculated from ticket Created and Closed timestamps; therefore, resolution-time-related findings should be interpreted with this data-quality limitation in mind.
5. The project does not include access to live operational systems or real-time data feeds.
